

Base optical module configuration

Overview

An optical module usually consists of an optical transmitting device (TOSA, including a laser), an optical receiving device (ROSA, including a photodetector), functional circuits, main control circuit board (PCBA), housing and optical (electrical) interface and other components. This chapter describes how to configure the Optical Amplifier Module and Protection Switching Module (PSM). Sometimes the installation and. CMIS-VCS provides a mechanism for the module to advertise its supported SI controls and the layout of those controls in the memory space. Whether you are creating a 100-Gbps or 400-Gbps, small form-factor pluggable (SFP) module, SFP+ transceiver, XFP module, CFP, X2/XENPAK module. The optical module serves as a crucial component in optical fiber communication systems, operating at the physical layer, which is the lowest layer in the OSI model. Different types of optical modules have different performance parameters such as speed.
