

Can an outdoor fiber optic cable be spliced if it s too short

Overview

Splicing is only needed if the cable runs are too long for one straight pull or you need to mix a number of different types of cables (like bringing a 48 fiber cable in and splicing it to six 8 fiber cables.)Fiber optic joints or terminations are made two ways: 1) splices which create a permanent joint between the two fibers or 2) connectors that mate two fibers to create a temporary joint and/or connect the fiber to a piece of network gear. Either joining method must have three primary characteristics. For outside plant work, fusion splicing is almost always the right choice. Mechanical splices are faster for emergency restoration but have higher typical loss (0. 1dB for fusion) and degrade over time in outdoor environments. For network managers and technicians, a poor splice can lead to significant signal degradation, network downtime, and costly troubleshooting. Splicing is most commonly used in the field but has application in cable assembly houses.
