

Distribution Network Automation Monitoring System

Overview

ADMS provides distribution utilities with real-time monitoring and control, network analysis, network optimization and outage management capabilities in an integrated software architecture, enabled by a high-performance, scalable, and cybersecure SCADA platform. This document offers a complete guide to Cisco's Smart Grid Field Area Network (FAN) solution architecture. It covers various ways this solution can be used, including:

- Monitoring secondary substations for scenarios like Fault Location, Isolation, and Service Restoration (FLISR) and Volt/VAR.

Distribution networks have traditionally had low levels of automation and control, primarily centered around the use of SCADA to monitor medium voltage (MV) feeders together with a lower usage of distribution management, voltage control, and automatic reconfiguration systems. However, the Distribution Automation Systems (DAS) are comprehensive control systems that automate the monitoring and management of power distribution networks. Our Network Manager ADMS delivers.

Article Content

Research on intelligent distribution network automation design

This paper summarizes the development of distribution network automation in China, and analyses the shortcomings of traditional distribution automation with the background of intelligent
