Overview

A brass, aluminum or copper busbar is a metallic strip or bar. They come in numerous shapes and sizes, which determine the maximum current (ampacity) it can carry in a safe and reliable manner. This also means it is crucial to install one that is most appropriate for your specific use. Its role is to receive power from your supply point and then dis. A grounding busbar is used in settings when you need or wish to have a common grounding – or earthing – point within your power distribution network. One of the major advantages of a brass, aluminum or copper ground bar is that you can put one anywhere in its enclosure or on the rack. As such, installation is quicker and more efficient than cables. Busbars are just one of the first-class power grounding products that we can supply. Our range includes other clips, connectors, and components that can maximize the efficiency of any power distribution network. Explore our selection of other grounding products that you may require: The role of a busbar in any network is a critical one. With the amount of power involved, it can be easy to overlook the importance of durable connectors. As some power applications become smaller and more complex, it becomes less effective to use methods such as welding or bolting to make the connections. This is where busbar connectors are increased. Our range of split bolt connectors and clips puts an emphasis on durability and performance. If you need to joint or connect copper earthing conductors within a power network, these are an excellent solution. Often, no specialist tools are required for installation and they eliminate any need for crimping. Instead, wires are stacked inside the bolt.
