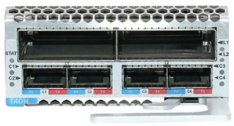
Switch cabinet busbar location



Overview

The horizontal busbar system of metal-enclosed switchgear is usually situated towards the top of the cubicle enclosure. Refer to Access to the Busbar Compartments. Busbars are the backbone of a low-voltage switchboard: rigid conductors that collect and distribute current safely between incoming devices and outgoing feeders. Busbars are typically made from copper or aluminum due to their excellent electrical conductivity and. Stud Terminals are used in control cabinet construction and in the area of drive motors as connection terminals for high rated currents of up to 240 mm². FTG offers a wide range of flexible wiring systems. 90m in length. Electrical cabinet design requires meticulous attention to component placement, particularly when configuring low voltage busbar systems. Proper busbar insulator placement is critical for ensuring electrical safety, operational efficiency, and long-term reliability in industrial power distribution.
