

Switchgear main busbar processing

Overview

Busbar processing machines are specialized equipment designed to automate and streamline the fabrication of busbars. These machines perform a range of operations, including cutting, punching, bending, and marking, with high precision and efficiency. Busbars are the backbone of a low-voltage switchboard: rigid conductors that collect and distribute current safely between incoming devices and outgoing feeders. A busbar is a metal bar, usually made of copper or aluminum, that carries electricity inside switchgear. However, the copper is exposed at bus joints, cable connections, auxiliary unit primary contact assemblies and primary switching element contact arms (usually). Ever wondered how busbars, the unsung heroes of electrical distribution, are processed and installed?

This article delves into the intricate steps of busbar selection, preparation, and installation, ensuring efficient and safe power distribution. You'll discover the essential tools and techniques.
