

What happens when a high current flows from an optical module

Overview

Impact: It may lead to high received optical power at the opposite end, thus causing the optical module at the opposite end to burn out due to continuously high received power. Reason: Optical module failure at this end. Even minor deviations—whether too high, too low, or unstable—can impact signal integrity, trigger service alarms, or interrupt traffic on DWDM, OTN, or long-haul optical line systems. Because optical networks. When the optical modules at both ends of the link work normally, the transmit optical power is within a certain range, which can be learned by checking the corresponding product datasheet or reading the module threshold on the switch. The device management or driver software has a bug. Remove and. Digital Diagnostic Monitoring (DDM), also called Digital Optical Monitoring (DOM), is one of those small features that saves hours in the field. Built into modern SFP/SFP+/ SFP28 /QSFP family modules and standardized by SFF-8472, DDM/DOM exposes real-time values for the module's temperature, supply. Can somebody help me, to understand why I see for one of the 10Gbase-LR module such abnormal Current values ?

I moved the module and link to another free port and the fault moved with it too. Therefore I expect to have a faulty 10Gbase-LR SFP module within the Port Nexus5548_1, eth1/24.
